

SIMATS ENGINEERING

ASSESSMENT TOOL 3

COURSE NAME: CRYPTOGRAPHY AND NETWORK SECURITY
COURSE CODE: CSA51

COURSE OUTCOME COVERED

CO2: Analyze Public Key crypto system strategies using RSA and key Exchange for Encryption algorithm to strengthen information security. (BL4,BL5)

Debugging & Optimisation Task : 10%

QUESTIONS:

Total Marks: 50

Annexure A

Code of Conduct:

I _____ (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the student:

Annexure A

Debugging & Optimisation Task

1. Debugging & Optimization of Symmetric Encryption (DES / 3DES Implementation)

A Python program implementing **DES and 3DES encryption** produces inconsistent ciphertext for identical inputs across multiple runs.

- A. Identify and fix logical and implementation errors in key scheduling and permutation steps.
- B. Optimize the code to reduce execution time for large input datasets (≥ 10 MB).
- C. Justify whether replacing DES/3DES with a modern cipher improves both security and performance.

2. Performance Analysis of Block Cipher Modes of Operation

A Python script implements **AES-like block cipher modes (ECB, CBC, CFB, OFB)** but suffers from high latency and memory inefficiency.

- A. Debug incorrect padding and IV handling causing decryption failures.
- B. Refactor the code to minimize redundant computations and memory usage.
- C. Compare and optimize the implementation to determine the most efficient mode for real-time secure communication.

3. Debugging RSA Cryptosystem Implementation

A Python-based **RSA encryption system** fails when encrypting large messages and occasionally produces incorrect plaintext after decryption.

- A. Identify issues in prime generation, key generation, and modular exponentiation.
- B. Optimize the algorithm using efficient techniques (e.g., fast exponentiation, Chinese Remainder Theorem).
- C. Evaluate the trade-offs between key size, security, and computational performance.

4. Optimization and Security Analysis of Diffie-Hellman Key Exchange

A Python implementation of the **Diffie-Hellman key exchange** is vulnerable to performance bottlenecks and potential security flaws.

- A. Debug incorrect shared key generation due to improper modular arithmetic.
- B. Optimize exponentiation operations for large prime values.
- C. Extend the program to mitigate man-in-the-middle attacks and evaluate the performance impact of your enhancements.

5. Debugging and Enhancing Elliptic Curve Cryptography (ECC) Implementation

A Python script implementing **Elliptic Curve Cryptography** for key exchange produces incorrect results for certain curve parameters.

- A. Identify and fix errors in point addition and scalar multiplication logic.
- B. Optimize the implementation using efficient algorithms (e.g., double-and-add).

- C. Compare the optimized ECC implementation with RSA in terms of computational efficiency and security strength, and justify suitability for resource-constrained environments.

RUBRICS FOR CALCULATION

Criteria	Weightage	Level 4 (Exemplary)	Level 3 (Proficient)	Level 2 (Developing)	Level 1 (Beginning)
Problem Identification	20%	Accurately identifies all errors and root causes with clear understanding	Identifies most errors with minor gaps	Identifies some errors but misses key issues	Unable to identify errors correctly
Debugging	25%	Applies systematic debugging techniques effectively to resolve issues	Uses appropriate debugging methods with minor errors	Limited debugging approach; requires guidance	Unable to debug or resolve issues
Optimization	20%	Optimizes code by significantly improving time complexity using efficient algorithms	Improves time complexity with minor gaps in efficiency	Limited improvement in time complexity	No improvement; inefficient approach retained
Analysis	20%	Demonstrates strong logical reasoning and clear justification of solutions	Shows reasonable analysis with some justification	Limited analysis; weak reasoning	No analytical reasoning demonstrated
Code Quality	15%	Produces clean, well-structured code with proper comments and documentation	Code is mostly clear with minor documentation gaps	Code lacks structure and proper documentation	Poorly written code with no documentation
